humquery(Sanger.ac.uk Clone requests:

On Jan 15, 2002 this sequence version replaced gi:18121468.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the

corresponding to the overlapping clone, as we submit sequences with

corresponding to the overlapping clone, as we submit sequences with

This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (i.e., phred quality)-

30); an attempt was made to resolve all sequencing problems, such

as compressions and repeats; all regions were covered by at least

one plasmid subclone or more than one M13 subclone; and the

assembly was confirmed by restriction digest. The following

abbreviations are used to associate primary accession numbers given

in the feature table with their source databases: Em; EMBL; Sw;

SWISSPROT; Tr:, TREMBL; WP; WORNEPP; Information on the WORMPEP

Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                      Center code: WIBR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                         Contact: sequence_submissions@genome.wi.mit.edu

                                                                                                                                                                                     The invention relates to four common polymorphisms in the gene encoding ATP-binding cassette transporter-1 (ABC1). ABC1 is associated with decreased ApoA-1 mediated efflux of cholesterol. The polymorphisms in ABC1 directly affects cellular lipid homeostasis, which is a key factor in the atherogenetic processes. The ABC1 polymorphisms are useful for diagnosing and treating lipid disorders, cardiovascular diseases (coronary heart diseases, atherosclerosis) and inflammatory diseases (psoriasis, lupus erythematosus). The identification of ABC1 as a transporter for interleukin-lbeta (IL-lbeta) identifies this gene as a candidate for treatment of inflammatory diseases including rheumatoid

```
The present sequence is that of cDNA encoding the human adenosine triphosphate (ATP) binding cassette transporter 1 (ABC1) protein (see AAM50227). The sequence includes an extended open reading frame (ORF) to that provided by the sequence in AAT70314, using an alternative ATG codon as initiation codon and thereby adding an extra 40 N-terminal amino acids to the encoded ABC1 protein (see AAM50228). The invention provides 4 common polymorphisms in the ABC1 gene. These were identified by sequencing the ABC1 gene in Card ferent Tangier kindreds. In the variant genes (numbering as in AAT0314), G is changed to A at position 596, T is changed to C at position 1136, A is changed to G at position 589 or G is changed to C at position 136, A is changed to G at position 3456, or any combination of these polymorphisms alter the amino acid sequence of ABC1 and therefore may affect its function. The 2 most common polymorphisms (G596A) and A2589G) are both associated with a decreased in vitro ApoA-I mediated efflux of cholesterol from monounclear phagocytes, a feature typical of Tangier disease. 3 of the variants (G596A) are significantly increased in a population of eature typical of Tangier disease. (CHD) relative to CHD-free control subjects. The use of the provided ABC1 polymorphisms for the diagnosis and treatment of lipid disorders, cardiovascular diseases, and inflammatory disease (CHD) relative to CHD-free control subjects. The use of the provided ABC1 transcribts or diseases, and inflammatory disease (CHD) relative to CHD-free cortol subjects is claimed. Modulation of ABC1 transcribts or proteins by antisense or ribozyme technology or RNA decoys is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    getttgeteettgtttttteeeeggttetgtttteteeeetteteeggaaggettgteaa 180

(HDL-C) level, a higher than normal trigilyceride level, or a cardiovascular disease, by administering a compound that modulates LXR-or RXR-mediated transcriptional activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular discase, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABCl expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected compounds useful for the treatment of a disease or condition selected triglyceride level, and a cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            High density lipoprotein-cholesterol; HDL-C; cardiovascular; ABC1; ds.

The present invention describes primer sets for synthesising 5602

[ull-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligounclectide complementary
to the complementary strand of a polynuclectide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises at 3'-end sequence. Where the
complementary strand of a polynucleotide which comprises a 6'-end
sequence and an oligonucleotide comprises at 3'-end sequence.
CC complementary to the
complementary strand of a polynucleotide which comprises at least 15 nucleotides and the combination of
the 5'-end sequence 3'-end sequence is selected from those defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
connected and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers allow obtaining of the full-length
cDNAs easily without any specialised methods. AAH03628 and
AAH13633 represent human amino acid sequences; and AAH13629 to AAH13632
cepresent cligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                             Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonuclectide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13639 to AAH13629 and AAH13639 represent human cDNA sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.

the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNas. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNas. The primers allow obtaining of the full-length cDNas asaily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to

```

```
polynuclectide which comprises a 3'-end sequence, where the comprises at least 15 nuclectides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynuclectides, particularly full-length convex. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs as also useful for the AAH13633 to AAH13632 and AAH13633 to AAH13632 to AAH13632 represent human anino acid sequences; and AAH13639 to AAH13632 represent oligonuclectides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequence and an oligonucleotide comprising a sequence complementary to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; cytokine; cell proliferation; cell differentiation; gene therapy;
                                                                                                                                                                                                                                                                                                                          The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
                                                                                                                                                                      Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gggctgcggcagggcagggcggggagctccgcgcaccaacagagccggttctcagggcgc 122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 gggctgcggcagggcagggcggggagctccgcgcaccaacagagccggttctcagggcgc 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           123 tttgctccttgttttttccccggttctgttttcccccttctccggaaggcttgtcaagg 182

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or eptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                               Ma Y;

Claim 1; Page 833-835; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The convention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby compounds of the invention have homology to known proteins, thereby polypeptides of the invention have homology to known proteins, thereby compared in instably into their probable bollogical activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell effect activity; activity; tissue growth activity; hammonodulatory activity; tissue growth activity; hammonodulatory activity; activin or inhibin-related activities; communicatic or chemotratics activities; hammonodulatory activity; activin or inhibin-related activities; communication activities; activities; hammonodulatory activities; activities, hammonodulatory activities; activities, polypeptides and nucleotides of thrombolytic activities; activities, polypeptides and nucleotides of thrombolytic activities; activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include cancers, hammatopoletic disorders (e.g., mypeloid or lymphoid cell activities) and abnormal arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal

```
vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                 ;

that exhibit activity elating to
                                                                                                                                                                The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, mematopolesis regulating activity, issue growth factor activity, immunomodulatory activity and activity in the diagnosis and/or iteratment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                            The sequence represents the coding sequence #2 of human ABC1. The nucleic acid sequence, primers and probes derived from the ABC1 sequence, and polypeptides and vectors are useful for the prevention of atherosclerosis, in a subject affected by a dysfunction in the reverse transport of cholesterol. The polypeptide encoded by the ABC1 gene is useful for screening for an active ingredient for the prevention or treatment of a disease resulting from dysfunction in the reverse transport of cholesterol. The nucleic acids and polypeptides are also useful for treating and preventing cardiovascular and neurological pathologies, and other diseases e.g. Tangler disease, lecithin-cholesterol (LCAT) deficiency, malaria and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  expressed sequence tag; secreted protein; cDNA isolation;

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             91 ccgggctgcggcagggcagggcggggggggctccgcgcccaacagagccggttctcagggc 150

```
The present sequence encodes a human adenosine triphosphate (APP)
binding cassette protein (ABC) 1 polypeptide. ABC1 resides in cell
membranes and utilises ATP hydrolysis to transport a wide variety of
membranes and utilises ATP hydrolysis to transport a wide variety of
ubstrates across the plasma membrane. ABC1 is a pivotal protein in
the apolipoprotein-mediated mobilisation of intracellular cholesterol
stores. ABC1 is defective in Tangier disease, a genetic disorder
characterised by abnormal HDL-cholesterol metabolism. The ABC1 gene is
localised to chromosome 9422-9431. The ABC1 genes and proteins are
useful for developing pharmaceutical agents for the treatment of heart
disease and other disorders associated with hypercholesterolemia and
atherosclerosis. The genes are useful for developing screening assays to
screen for compounds that regulate the expression of genes associated
with cholesterol transport. The genes and proteins are also useful for
the disorders associated with hypercholesterolemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

ABC1 is a pivotal protein in stores. ABC1 is defective in Tangiar disease, a genetic disorder characterised by abnormal HDL-cholesterol metabolism. The ABC1 genetic disorder is defective in Tangiar disease, a genetic disorder characterised by abnormal HDL-cholesterol metabolism. The ABC1 gene is localised to chromosome 9q22-9q31. The ABC1 genes and proteins are useful for developing pharmaceutical agents for the treatment of heart disease and other disorders associated with hypercholesterolemia and atherosclerosis. The genes are useful for developing screening assays to screen for compounds that regulate the expression of genes associated with cholesterol transport. The genes and proteins are also useful for are also useful as diagnostic indicators of cardiovascular disease and

Adenosine triphosphate (ATP) binding cassette (ABC) polynucleotide, useful for the development of agents for the treatment of heart disease and other disorders associated with hypercholesterolemia and atherosclerosis

Disclosure; Page 148-154; 215pp; English.

The present sequence encodes a human adenosine triphosphate (ATP)

binding cassette protein (ABC) 1 polypeptide, and is isolated from
a Tandier disease patient. ABC1 resides in cell membranes and utilises
ATP hydrolysis to transport a wide variety of substrates across the
plasma membrane. ABC1 is a pivoteal protein in the apolipoprotein-mediated
mobilisation of intracellular cholesterol stores. ABC1 is defective in
Tangier disease, a genetic disorder characterised by abnormal
HDL-cholesterol metabolism. The ABC1 gene is localised to chromosome
9422-9431. The ABC1 genes and proteins are useful for developing
pharmaceutical agents for the treatment of heart disease and other
disorders associated with hypercholesterolemia and atherosclerosis. The
genes are useful for developing screening assays to screen for compounds
transport. The genes and proteins are also useful for are also useful
as diagnostic indicators of cardiovascular disease and other disorders
associated with hypercholesterolemia.
